

## IBM Cloud Gallery

Estimated Time (45 min)

IBM Cloud Gallery is a growing collection of data sets, notebooks, and project templates. In this lab, you will use *IBM cloud Gallery* to explore different datasets. As we have learnt in the course, the data is not only about numbers, it can be anything such as numeric data, text data, images, videos, audios etc. You will work on three samples.

**Sample 1** in which you will learn about the dataset in which only numeric attributes are present.

**Sample 2** in which you will learn about the dataset in which numeric & text attributes are present.

**Sample 3** in which you will analyze how the Jupyter Notebooks look like. How a Data Scientist create the models?

Let's take a look that how different datasets are used by Data Scientist.

### Objectives :

You will learn to:

- Explore the IBM Cloud Gallery
- Evaluate Numeric dataset
- Evaluate dataset with Non-Numeric attributes
- Evaluate Jupyter Notebook

### Exercise 1: Evaluate Numeric dataset

1. Click on the link: <https://dataplatform.cloud.ibm.com/gallery>.
2. Select *All Filters*. From *Format* select *Data* and from *Topic* select *Energy & Utilities, Environment and Industry Accelerator*

All filters

X	Y	month	day	FFMC	DMC	DC	ISI
X	Y	month	day	FFMC	DMC	DC	ISI
7	5	mar	fri	86.2	26.2	94.3	5.1
7	4	oct	tue	90.6	35.4	669.1	6.7
7	4	oct	sat	90.6	43.7	686.9	6.7
8	6	mar	fri	91.7	33.3	77.5	9

Explore the data

The data is related to forest fires where the aim is to predict the burned area of forest fires, in the northeast region of Portugal, by using meteorological and other data.

Attribute Information:

- 1. X - x-axis spatial coordinate within the Montesinho park map: 1 to 9
- 2. Y - y-axis spatial coordinate within the Montesinho park map: 2 to 9
- 3. month - month of the year: 'jan' to 'dec'
- 4. day - day of the week: 'mon' to 'sun'
- 5. FFMC - FFMC index from the FWI system: 18.7 to 96.20
- 6. DMC - DMC index from the FWI system: 1.1 to 291.3
- 7. DC - DC index from the FWI system: 7.9 to 860.6
- 8. ISI - ISI index from the FWI system: 0.0 to 56.10
- 9. temp - temperature in Celsius degrees: 2.2 to 33.30
- 10. RH - relative humidity in %: 15.0 to 100
- 11. wind - wind speed in km/h: 0.40 to 9.40
- 12. rain - outside rain in mm/m2 : 0.0 to 6.4
- 13. area - the burned area of the forest (in ha): 0.00 to 1090.84  
(this output variable is very skewed towards 0.0, thus it may make sense to model with the logarithm transform).

Exercise 2: Evaluate Non-Numeric dataset

The data doesn't have to be only based on numbers. Data can be text, images and other types as well. Let's look into data having text values.

- 1. Use the All Filters. From Format select Data and from Topic select Economy and Business.
- You will get mutiple datasets given. Scroll down and select Airbnb Data for Analytics: Trentino Reviews (If you will not get the data use the Load More option)

5064970	29436648	2015-04-07	11582326	Stephan	Marina is very kind and friendly. We enjoyed her apartment, that was very modern and clean with two rooms, a bathroom and the kitchen inside the living-room with a balcony that goes to the north. All in all a good flat to stay. Thanks!	apartment + Wi-Fi + parking!	
5064970	33481368	2015-05-28	20223641	Annika	Marinas flat was a dream! Spotlessly clean, very cute decorated..... and the balcony was the biggest plus! Marina welcomed us in her flat and gave us many tips for hiking, mountainbiking and restaurants. You have to ask her for the best Gelateria in Riva. The best ice cream I 've ever eaten! We will definitely come back! Thank you Marina for the awesome time we could spend in your flat. Annika & Joachim	apartment + Wi-Fi + parking!	

Explore the data

Airbnb, Inc. is an American company that operates an online marketplace for lodging, primarily homestays for vacation rentals, and tourism activities. Airbnb guests may leave a review after their stay, and these can be used as an indicator of airbnb activity. The minimum stay, price and number of reviews have been used to estimate the occupancy rate, the number of nights per year and the income per month for each listing.

This data can be used in various ways - To analyze the star ratings of places, to analyze the location preferences of the customers, to analyze the tone and sentiment of customer reviews and many more. Airbnb uses location data to improve guest satisfaction.

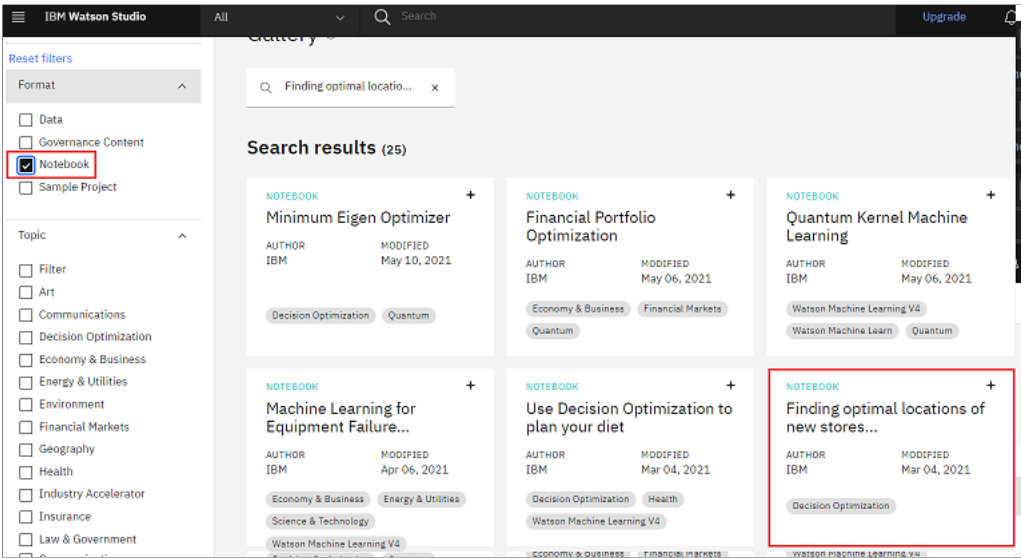

💡 Can you think of what you can use this data for?

The dataset comprises of three main tables:

- listings - Detailed listings data showing 96 attributes for each of the listings. Some of the attributes used in the analysis are price(continuous), longitude (continuous), latitude (continuous), listing\_type (categorical), is\_superhost (categorical), neighbourhood (categorical), ratings (continuous) among others.
- reviews - Detailed reviews given by the guests with 6 attributes. Key attributes include date (datetime), listing\_id (discrete), reviewer\_id (discrete) and comment (textual).
- calendar - Provides details about booking for the next year by listing. Four attributes in total including listing\_id (discrete), date(datetime), available (categorical) and price (continuous).

Exercise 3: Evaluate Jupyter Notebook

Use the *All Filters*. From *Format* select *Notebook* and select *Finding optimal locations of new stores using Decision Optimization* (If you will not find the notebook use the **Load More** option to load the notebooks)

This notebook shows you how Decision Optimization can help to prescribe decisions for a complex constrained problem using Python to help determine the optimal location for a new store.

The objective is to minimize the total distance from libraries to coffee shops so that a book reader always gets to our coffee shop easily. It can be done by analyzing and displaying the location of the coffee shops on a map.

**Finding optimal locations of new stores using Decision Optimization**

Tags

Decision Optimization

This notebook shows you how Decision Optimization can help to prescribe decisions for a complex problem using CPLEX Modeling for Python to help determine the optimal location for a new store. This requires the Commercial Edition of CPLEX engines, which is included in the latest Python XS + DO environment in Watson Studio.

## Finding Optimal Locations for New Stores

This notebook is an example of how **Decision Optimization** can help to prescribe decisions for a constrained problem.

When you finish this notebook, you'll have a foundational knowledge of *Prescriptive Analytics*.

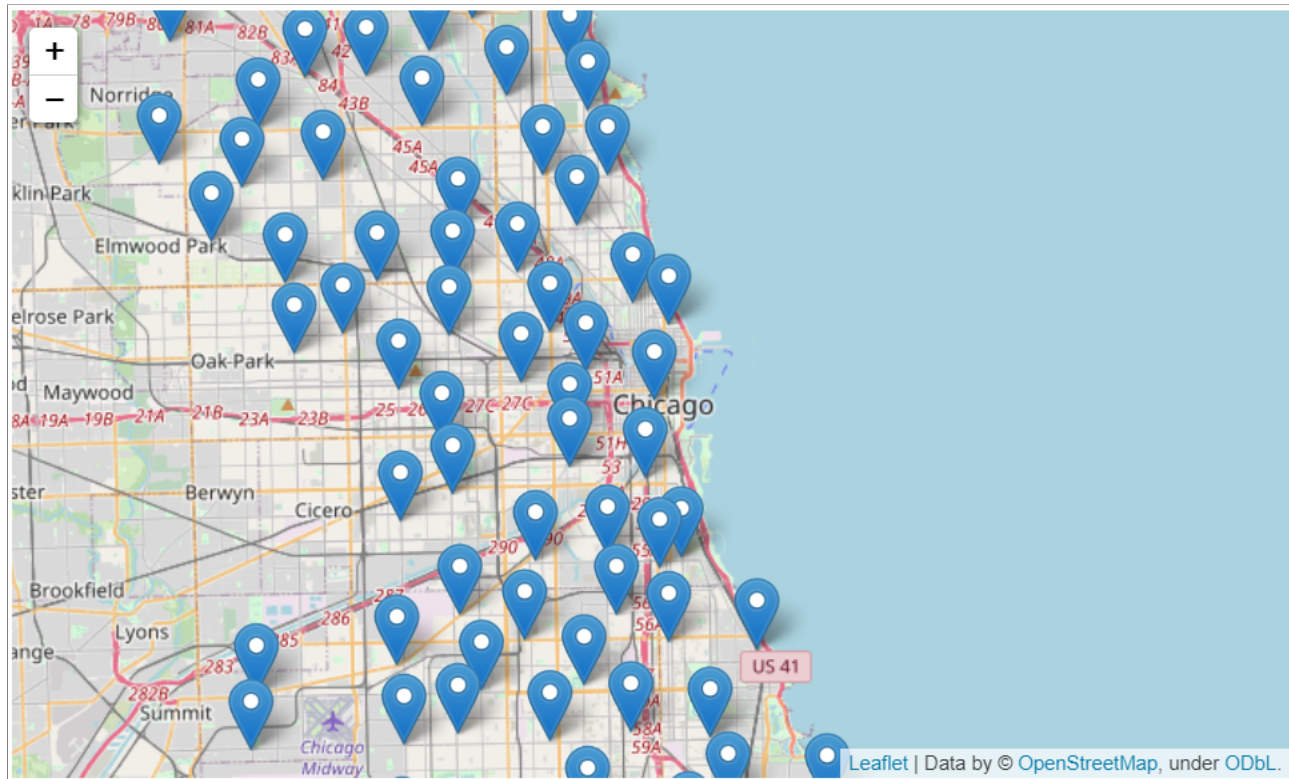

This notebook requires the Commercial Edition of CPLEX engines, which is included in the latest Python 3.7 XS + DO in Watson Studio.

Table of contents:

- [Describe the business problem](#)
- [How decision optimization \(prescriptive analytics\) can help](#)
- [Use decision optimization](#)

When we validate the dataset, the locations on map are separated.

But it is impossible to determine where to ideally open the coffee shops by just looking at the map.

This is solved by an optimization model that will help us determine where to locate the coffee shops in an optimal way.

## Summary

In this lab, you have learnt about to explore datasets and notebooks in IBM cloud Gallery.
